ABSTRACT

In this data article, by using inductively coupled plasma optical spectrometry (ICP-OES)¹, we aimed to (1) determine the concentration levels of As, Ag, Sr, Sn, Sb, and Mo in the sediments and the shells of *Trachycardium lacunosum* simultaneously in two separated areas (unpolluted and polluted areas) (2) comparison between the metal contents of sediments in the unpolluted and polluted areas as well as shells. Analysis of data showed that sediment as well as shell samples in polluted area contained significantly higher concentration levels of all measured metals compared with unpolluted area.

¹ Inductively Coupled Plasma Optical Spectrometry.

Specifications Table

Subject area	Toxicology
More specific subject area	Heavy metal contents in marine environment
Type of data	Table and figure
How data was acquired	ICP-OES (SPECTRO (Germany), Spectro arcos)
Data format	Raw, analyzed
Experimental factors	All sediment samples were dried at 105 °C for 24 h, homogenized, and packed in polyethylene bags and stored at –20 °C prior to analysis. The shell samples washed under a jet of tap water to remove algae, sand, clay and other impurities, and then dried at 105 °C for 24 h and stored at –20 °C prior to analysis
Experimental features	Evaluate the metal contents of As, Ag, Sr, Sn, Sb, and Mo in sediments and shells of <i>Trachycardium lacunosum</i> in the northern part of the Persian Gulf
Data source location	Bushehr, Asaluyeh bay, along the Persian Gulf, Iran
Data accessibility	Data is with this article

Value of the data

- Data can be used as a base-line data for metal concentration levels in marine environments and understanding industrial activities effects on these environments.
- Data shown here can be useful for policy makers, managers, and all related stakeholders, companies, agencies, and institutes working in the fields of environment by imposing proper measures to protect environment.
- Data shown here may serve as benchmarks for other groups working or studying in the field of effluent disposal, pollution control, aquatic ecosystem, toxicology.

1. Data

In the unpolluted area the concentration levels of As, Ag, Sr, Sn, Sb, and Mo in sediment samples ranged from 0.07–0.81 (Mean: 0.3), 0.4–0.9 (Mean: 0.65), 85–172 (Mean: 134.3), 1.3–3.6 (Mean: 2.63), 2–9.4 (Mean: 3.79) 0.24–0.85 (Mean: 0.45) $\mu\text{g g}^{-1}$ respectively while in the polluted area the concentration levels of As, Ag, Sr, Sn, Sb and Mo ranged from 11.2–16.3 (Mean: 13.4), 1.1–1.7 (Mean: 1.33), 249–1354 (Mean: 715), 4.12–8.32 (Mean: 5.3), 5.9–20.7 (Mean: 16.16), 1.29–9.52 (Mean: 4.7) $\mu\text{g g}^{-1}$ respectively (Table 1 and Fig. 1). In the unpolluted area the concentration levels of As, Ag, Sr, Sn, Sb, and Mo in shell samples ranged from 0.01–0.06 (Mean: 0.035), 0.001–0.008 (Mean 0.004), 21–45 (Mean: 27.8), 0.1–1.6 (Mean: 0.71), 0.5–2.7 (Mean: 1.33), 0.01–0.05 (Mean: 0.03) $\mu\text{g g}^{-1}$ respectively while in the polluted area the concentration levels of As, Ag, Sr, Sn, Sb and Mo ranged from 1.32–6.6 (Mean: 4.15), 0.11–0.33 (Mean: 0.17), 78–185 (Mean: 131.7), 2.1–3.3 (Mean: 2.5), 3.9–13.8 (Mean: 8.3), 0.7–9.4 (Mean: 4.7) $\mu\text{g g}^{-1}$ respectively (Table 2 and Fig. 2).

2. Experimental design, materials and methods

2.1. Study area description

Two different areas were selected in the Asaluyeh as sampling points including polluted area (Nayband Bay) and unpolluted area (Lavar-e-Saheli) (Fig. 3).

Fig. 1. Comparison of metals concentration levels in the sediment samples in polluted and unpolluted areas.

2.2. Sample collection

Samples from surface sediments (0–10 cm) and shells of *Trachycardium lacunosum* in selected polluted and unpolluted areas were collected. 20 sediment samples and 18 shell samples in polluted area and 19 sediment samples and 13 shell samples in unpolluted area were collected during summer 2013. After transferring the collected sediment samples to the laboratory, the samples were dried at 105 °C for 24 h, homogenized, and packed in polyethylene bags and stored at –20 °C prior to analysis. The shell samples washed under a jet of tap water to remove algae, sand, clay and other impurities, and then dried at 105 °C for 24 h and stored at –20 °C prior to analysis.

2.3. Reagents

All the employed oxidants and mineral acids including HNO₃, H₂O₂, HF, HClO₄ and HCl were of suprapure quality (Merck, Darmstadt, Germany). All glassware and plastic were cleaned by soaking overnight in a 10% (w/v) HNO₃ solution and then rinsed with deionized water before use. All solutions were prepared by using ultrapure water (18.2 MΩ cm).

Fig. 2. Comparison of metals concentration levels in the shell samples in polluted and unpolluted areas.

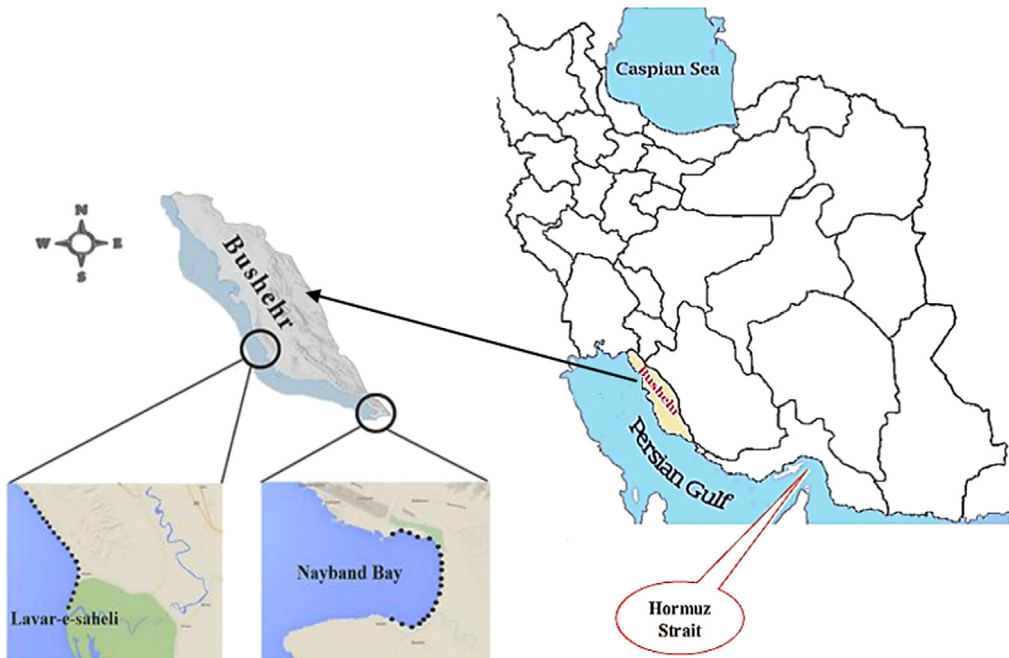

Fig. 3. The map and locations of sampling station.

2.4. Digestion and analytical procedures

The sediment samples (0.5 g) were digested with 2 ml HNO_3 (65%), 6 ml HCl (37%) in a microwave digestion system for 30 min and then diluted to 25 ml with ultrapure water and stored in polyethylene bottle until analysis. 0.5 g of powdered shell was completely digested in a Teflon cup using a mixture of conc. HNO_3 , HClO_4 and HF with the ratio 3:2:1 respectively. Acids were slowly added to dried sample and left overnight before further process. Then, the samples were heated at 200 °C then left to cool and filtered. The filtered solution was justified to a volume of 25 ml. Blank digest was also performed in the same way. ICP-OES instrumental method [1–3] was used to determine the concentration level of metals including As, Ag, Sr, Sn, Sb and Mo (Table 3).

Table 3
ICP-OES instrumental operating details.

Parameters	
Company, model	SPECTRO (Germany), Spectro arcos
RF generator power (W)	1400
Frequency of RF generator (MHz)	27.12 MHz
